Limitations & Next Steps.....	7

Executive Summary

Overview

This report presents a comprehensive analysis of the provided dataset, highlighting key patterns, trends, and actionable insights derived through automated AI-powered analysis.

Key Findings

- {"sections": [{"heading": "Analysis Overview", "content": "The total revenue generated is \$817,860.05, indicating a substantial sales performance. This revenue is a result of selling 49,574 pizzas across 21,350 orders, with an average order value of \$38.31. The business has demonstrated a strong sales volume, with a significant total revenue that suggests a healthy profit margin. This performance is crucial for the business as it provides a solid foundation for future growth and expansion."}, {"heading": "Statistical Evidence", "content": "The mean unit price of a pizza is \$16.49, which is very close to the median unit price of \$16.50, suggesting a relatively symmetrical distribution of pizza prices. The standard deviation of total price is \$4.44, indicating moderate variability in prices. The minimum total price is \$9.75, while the maximum is \$83.00, highlighting a wide range of price points. There are 613 outliers, which may indicate unusual sales patterns or errors in data coll"}]
- {"sections": [{"heading": "Analysis Overview", "content": "The average amount spent per order is \$38.31, indicating that customers typically spend around this amount when making a purchase. With a total of 21,350 orders, this translates to a significant revenue stream for the business. The presence of outliers, with 588 orders exceeding the upper IQR threshold, suggests that some customers are willing to spend substantially more, with the maximum order value reaching \$444.20. This highlights an opportunity to encourage more customers to increase their spending."}, {"heading": "Statistical Evidence", "content": "The mean order value of \$38.31 is higher than the median order value of \$32.50, indicating a positively skewed distribution. The standard deviation of \$30.65 is relatively high, suggesting a wide range of order values. The minimum order value is \$9.75, while the maximum is \$444.20, highlighting the significant variability in order totals. The skewness of 3.47 and kurtosis o"}]
- {"sections": [{"heading": "Analysis Overview", "content": "The total revenue for pizzas averages \$16.82, with a median of \$16.50 and a standard deviation of \$4.44, indicating a relatively stable distribution of revenue across pizzas. With a total of

48,620 records, this data provides a comprehensive view of pizza sales. The presence of 613 outliers suggests that there are some extreme values that may warrant further investigation. Overall, this data provides valuable insights for the business to optimize its pizza offerings and pricing strategy."}, {"heading": "Statistical Evidence", "content": "The dataset consists of 48,620 records, with a mean revenue of \$16.82 and a median revenue of \$16.50, indicating a slightly skewed distribution. The standard deviation of \$4.44 is relatively high, suggesting significant variability in revenue across pizzas. The minimum revenue is \$9.75 and the maximum revenue is \$83.00, highlighting a wide range of revenue values. The skewness of 1.73 and kurt

Key Conclusions

1. What Is The Total Revenue Generated, The Total Number Of Pizzas Sold, And The Total Number Of Orders Placed?

Figure 1: What Is The Total Revenue Generated, The Total Number Of Pizzas Sold, And The Total Number Of Orders Placed?

Key Statistics

Metric	Value
Total Revenue	817,860.05
Total Pizzas Sold	49,574
Total Orders	21,350
Avg Order Value	38.31
Mean Unit Price	16.49
Median Unit Price	16.50
Std Total Price	4.44
Min Total Price	9.75
Max Total Price	83.00
Outlier Count	613
Skewness	1.73
Kurtosis	8.90
Spearman Price Quantity	0.01
Top Category By Revenue	Classic

Analysis Overview

2. What Is The Average Amount Spent Per Order? Are There Any Outliers In Order Totals Using The Iqr Method?

Figure 2: What Is The Average Amount Spent Per Order? Are There Any Outliers In Order Totals Using The Iqr Method?

Key Statistics

Metric	Value
Total Orders	21,350
Average Order Value	38.31
Median Order Value	32.50
Std Order Value	30.65
Min Order Value	9.75
Max Order Value	444.20
Outlier Count Iqr	588
Skewness Order Value	3.47
Kurtosis Order Value	18.65
Top Category By Revenue	Classic
Quantity Price Correlation	0.23

Analysis Overview

["sections": [{"heading": "Analysis Overview", "content": "The average amount spent per order is \$38.31, indicating that customers typically spend around this amount when making a purchase. With a total of 21,350 orders, this translates to a significant revenue stream for the business. The presence of outliers, with 588 orders exceeding the upper IQR threshold, suggests that some customers are willing to spend substantially more, with the maximum order value reaching \$444.20. This highlights an opportunity to encourage more customers to increase their spending."}, {"heading": "Statistical Evidence", "content": "The mean order value of \$38.31 is higher than the median order value of \$32.50, indicating a positively skewed distribution. The standard deviation of \$30.65 is relatively high, suggesting a wide range of order values. The minimum order value is \$9.75, while the maximum is \$444.20, highlighting the significant variability in order totals. The skewness of 3.47 and kurtosis of 18.65 further confirm the non-normal distribution of order values."}]]

3. What Are The Top 5 And Bottom 5 Pizzas Based On Total Revenue And Quantity Sold?

Key Statistics

Metric	Value
Total Records	48,620
Mean Revenue	16.82
Median Revenue	16.50
Std Revenue	4.44
Min Revenue	9.75
Max Revenue	83.00
Outlier Count	613
Skewness	1.73
Kurtosis	8.90
Spearman Correlation	0.23
Top Revenue Pizza	The Thai Chicken Pizza
Bottom Revenue Pizza	The Brie Carre Pizza
Top Quantity Pizza	The Classic Deluxe Pizza
Bottom Quantity Pizza	The Brie Carre Pizza
Top Category By Revenue	Classic

Analysis Overview

{\"sections\": [{\"heading\": \"Analysis Overview\", \"content\": \"The total revenue for pizzas averages \$16.82, with a median of \$16.50 and a standard deviation of \$4.44, indicating a relatively stable distribution of revenue across pizzas. Limitations & Next Steps

This analysis was generated automatically using AI-powered tools. Results should be validated by domain experts before making critical decisions.

Recommended Next Steps

- Validate key findings with domain experts and additional data sources.
- Investigate any identified outliers or anomalies in further detail.
- Apply predictive modeling to forecast future trends based on current patterns.
- Set up automated monitoring dashboards to track key metrics over time.
